WIRE BACKING

Over open wood frame construction, attach wire of not less than No. 18 gage to vertical surfaces, stretched taut horizontally and spaced at not more than 6 inch intervals. Approved self furring paper backed lath may be used in lieu of wire backing.

WEATHER PROTECTION

Over open or solid wood backing frame construction to which metal lath is to be applied, apply water resistant paper to exterior vertical surfaces. Apply paper to supports and lap upper courses over lower courses not less than 2"; lap foundation at least 2"; lap vertical joints at least 6". Double paper should be installed over solid wood backing.

WEEP SCREED

A minimum No. 26 galvanized sheet gage, corrosion-resistant weep screed with a minimum vertical attachment flange of 3 ½ inches shall be provided at or below the foundation plate line on all exterior stud walls. The screed shall be placed a minimum of 4 inches above the earth or 2 inches above paved areas and shall be of a type which will allow trapped water to drain to the exterior of the building. The weather-resistive barrier shall lap the attachment flange, and the exterior lath shall cover and terminate on the attachment flange of the screed.

EXTERIOR LATH

Metal wire lath shall be minimum 16 gage wire and shall be installed with the long dimension of the sheet perpendicular to supports. Metal lath shall be lapped ½" at side and 1" at ends. Stagger ends of lath to avoid continuous joints on the same support. Metal lath shall be attached to vertical supports with 1-1/4" No. 12 gage 3/8" head non corrosive furring nails every 6" maximum on supports. If self furring lath is used, refer to the manufacturers installation instructions for the recommended attachment.

EXTERIOR PLASTER

Plastering with cement plaster shall not be less than three coats when applied over metal lath or wire fabric lath. The *first* coat shall be applied with sufficient material and pressure to fill solidly all openings in the lath. The surface shall be scored horizontally sufficiently rough to provide adequate bond to receive the second coat. The first coat is commonly known as the scratch coat. The first coat shall not be less than 3/8" in thickness. The *second* coat shall be brought out to proper thickness of 3/8", rodged and floated sufficiently rough to provide adequate bond for the finish coat. The second coat shall have no variation greater than ¼ inch in any direction under a 5 foot straight edge. Minimum time interval between brown coat and color coat is 7 days. The *third* or color coat shall be applied with sufficient material and pressure to bond
